

Guide:

**Javascript library:**

Import the javascript file as a library. Can be seen at Line 66 in the file.

**Initiate the library:**

Do as seen on line 87 - 113.

For the test application use the clientId provided here, seen on line 32-33. For our application we will get a new clientID.

*assistant* will here become a object of that library and used to call it.

**Use:**

Line 183 -> Login if required. This is the function we will use to get the token. Calling this should show a popup of all available login methods!

When we are signed in we will get a token. This token must be used in the HTTP requests to Region Östergötlands API's, and should be attached as an *Authentication* header.

How to call their API can be seen in function getServiceRequest, line 131.

On line 139 they add the token as a header.
